

The background of the slide is a dark blue field filled with a dense network of glowing fiber optic lines. These lines radiate from a central point, creating a starburst effect. The lines are primarily blue and white, with some red and green lines interspersed. In the center-left, there is a large, stylized 'AI' logo. The 'A' is formed by a bright blue outline, and the 'I' is a solid blue vertical bar. The logo is set against a circular, segmented background that resembles a fiber optic cable cross-section.

AI

AI INTEGRATION IN **BIOTECHNOLOGY**

Key Points

[Market Data](#)

Development: 10+ years
→ 3–6 years. Costs cut
70%.

Economic impact of
\$350–410B annually for
pharma in 2025.

19–20% CAGR

AI in biotech valued at
\$4B in 2024, reaching
27.43B by 2034

AI drugs show 80–90%
Phase I success vs. 40–
65% traditional.

15+ AI-designed
drugs in trials.

The Biotech Challenge

- \$2.6B per approved drug
- 90% clinical trial failure rate 
- 10-15 years average development time
- 40 exabytes genomic data by 2025

Exabyte – One billion gigabytes

Why AI Now?

- Computing Power: 1000x increase in decade.
- Big Data: 200M+ protein structures (AlphaFold), billions of genomic sequences.
- Deep Learning: AlphaFold solved 50-year problem. 2024 Nobel Prize to DeepMind.
- Cloud Access: AWS, Google Cloud democratizing supercomputing.

From DNA to Protein

Case Study: AlphaFold

The Achievement:

50-year protein folding problem solved.

200M+ structures predicted.

AlphaFold 3:

Predicts all biomolecular interactions (proteins, DNA, RNA, ligands). 50%+ accuracy improvement.

Impact:

2M+ researchers in 190 countries. 35,000+ citations.

Saved hundreds of millions of research years.

2024 Nobel Prize to Hassabis & Jumper for protein structure prediction.

Applications: Malaria vaccines, cancer treatment, COVID-19 research.

AI Technology Stack

- Machine Learning (40.9% of methods)
- NLP: Mining millions of papers, clinical notes, extracting insights.
- Computer Vision: 95%+ cancer detection accuracy. 950+ FDA-cleared AI devices (2024).
- Generative AI: AlphaFold 3 with 50% improvement over previous methods.

Drug Discovery Revolution

Target ID: Weeks vs. 3-5 years using ML on genomic data.

Virtual Screening: Atomwise screens 10M+ compounds daily, 750+ partnerships.

Lead Optimization: Insilico: 18-month timeline vs. 4-6 years.

Companies: 136 optimized compounds/year vs. 2,500 over 5 years traditionally.

Genomics & Precision Medicine

AI analyzing millions of genetic variants instantly for disease-causing mutations.

Patient Stratification: 50% improvement in trial enrollment.

Biomarker Discovery: Multi-omics integration (genomics + proteomics + metabolomics).

Key Players: Tempus AI, Sophia Genetics, Deep Genomics.

AI in Clinical Diagnostics

950+ FDA-cleared AI/ML devices (mid-2024).

956 radiology, 10+ ophthalmology.

PathAI: 20%+ diagnostic accuracy improvement. Images of biopsies.

Market: \$13.7B (2024) → \$255B by 2033.

Applications: 95%+ cancer detection accuracy, rare disease identification, real-time decision support.

Therapeutic Design

De Novo Design: Generative AI creating novel molecules.

Antibody Engineering: AbCellera using AI. Phase II trials with AI antibodies. Days vs. months for optimization.

RNA Therapeutics: AI designing mRNA vaccines with enhanced stability.

Protein Engineering: Creating enzymes for biofuels, biodegradable plastics.

Clinical Trial Optimization

Recruitment: AI matching algorithms cut timelines 50%+. NetraMark AI analytics.

Site Selection: Predictive models identifying best-performing sites.

Safety Monitoring: Beacon Biosignals raised \$86M (Nov 2025) for AI brain health biomarkers.

Impact: 70%+ sites meet enrollment (vs. 30% traditional). 30-40% timeline reduction.

Real-World Success Stories

Atomwise

10M+ compounds screened daily. 750+ global partnerships. Deep learning for drug-target interactions.

Success: Multiple candidates in clinical development for Ebola, MS, rare diseases.

Insilico Medicine

Historic: ISM001-055 (Rentosertib) – first AI drug+target in Phase 2a trials. USAN approved March 2025.

Timeline: 18 months vs. 4–6 years traditional. Novel target discovered by AI.

Pipeline: ISM3312 (COVID-19), ISM3091 (cancer). \$400M+ raised.

Schrödinger

NDI-034858: TYK2 inhibitor, best-in-class Phase II psoriasis results.

Acquired by Takeda for \$4B (2022). Now Phase III – could be first approved AI drug.

Future Trends (2025–2030)

Foundation Models: GPT-style for biology. ESM (Meta), AlphaFold 3, ProGen. Major deployments 2025–2026.

Quantum Computing: IBM, Google, IonQ advancing. 5–10 years to practical impact.

Real-Time Decision Support: AI embedded in EHRs. Widespread 2026–2028.

Autonomous Labs: Recursion, Emerald Cloud Lab. 100x faster experiments. Mainstream 2027–2030.

Investment Requirements

Technology (\$2–5M): Cloud (\$500K–1M), AI platforms (\$500K–2M), data infrastructure (\$500K–1M).

Talent (\$1–3M annually): 10–15 hires. AI engineers \$150–250K, data scientists \$120–200K.

Partnerships (\$500K–2M): Platform licenses, CROs, consulting.

Total Year 1: \$5–10M

ROI: 2–3x by Year 3. 5–10x by Year 5. Break-even: 18–24 months.
